Multi-objective Optimisation Problems

A multi-objective optimisation problem is formulated as

$$\min \{f(x) : x \in \mathcal{X}\}, \quad (\text{MOP})$$

where $f : \mathbb{R}^n \rightarrow \mathbb{R}^p$, and \mathcal{X} is a feasible set. we assume that \mathcal{X} is a nonempty and compact set.

$$\min \{Cx : x \in \mathcal{X}\} \quad (\text{MOLP})$$

- C is a $p \times n$ matrix, whose rows are the coefficients of objective functions $c^k x$, $k = 1, \dots, p$.
- $\mathcal{X} := \{x \in \mathbb{R}^n : Ax \geq b\}$, where $A \in \mathbb{R}^{m \times n}$, $b \in \mathbb{R}^m$.
- $\mathcal{Y} := \{y \in \mathbb{R}^p : y = Cx, x \in \mathcal{X}\}$ is the feasible set in objective space \mathbb{R}^p .
- $\mathcal{P} := \mathcal{Y} + \mathbb{R}_{\geq}^p$ is the extended feasible set in objective space \mathbb{R}^p .

Example

$$\begin{aligned} & \min \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} \\ \text{s.t.} \quad & \begin{pmatrix} 4 & 1 \\ 3 & 2 \\ 1 & 5 \\ -1 & -1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} \geq \begin{pmatrix} 4 \\ 6 \\ 5 \\ -6 \end{pmatrix} \\ & x_1, x_2 \geq 0. \end{aligned}$$

Optimisation over the Non-dominated Set

(ON)

$$\max \{M(y) : y \in \mathcal{P}_N\}, \quad (\text{ON})$$

where \mathcal{P}_N is the non-dominated set of a multi-objective optimisation problem.

Optimisation over the Non-dominated Set

(ON)

$$\max \{M(y) : y \in \mathcal{P}_N\}, \quad (\text{ON})$$

where \mathcal{P}_N is the non-dominated set of a multi-objective optimisation problem.

(P)

The simplest form of (ON) is

$$\max \{\mu^T y : y \in \mathcal{P}_N\}. \quad (\text{P})$$

Motivation

- 1** The burden of generating the entire set of non-dominated points may be saved.
- 2** Decision makers may be overwhelmed by the immensity of the whole non-dominated set and may not be able to choose a preferred solution from it.

Challenges

- 1** The feasible set of (P), \mathcal{P}_N , is a nonconvex set even in the case of (MOLP).
- 2** The feasible set of (P) problems, \mathcal{P}_N , can not be expressed in the format as a system of inequalities.
- 3** Mathematically, problem (P) is a difficult global optimisation problem, the number of local optima can be very large.

Revised version of Benson's Algorithm to Solve (MOLP) in primal objective space (Löhne et al. (2014))

- 1: Compute the optimal value y_i^l of $(P_1(e^i))$, for $i = 1, \dots, p$.
 $Y_N := \emptyset$, for $i = 1, \dots, p$.
- 2: Set $\mathcal{S}^0 := \{y^l\} + \mathbb{R}_{\geq}^p$; $V_{\mathcal{S}^0} := \{y^l\}$ and $k := 1$.
- 3: **while** $V_{\mathcal{S}^{k-1}} \not\subset \mathcal{P}$ **do**
- 4: Choose a vertex s^k of \mathcal{S}^{k-1} such that $s^k \notin \mathcal{P}$.
- 5: Compute an optimal solution (x^k, z^k) to $P_2(s^k)$ and its dual variable (u^k, λ^k) .
- 6: Set
 $\mathcal{S}^k := \mathcal{S}^{k-1} \cap \{y \in \mathbb{R}^p : \varphi(y, (\lambda_1^k, \dots, \lambda_{p-1}^k, b^T u^k)) \geq 0\}$;
 Update $V_{\mathcal{S}^k}$; $Y_N := Y_N \cup Cx^k$.
- 7: Set $k := k + 1$
- 8: **end while**

Theorem

(P) has the same optimal solution as (RP), if and only if $\mu \in \mathbb{R}_{\leq}^p$.

$$\max \{ \mu^T y : y \in \mathcal{P} \} \text{ (RP)}$$

Properties of (P)

Theorem

For all $\mu \in \mathbb{R}^p \setminus \mathbb{R}_{\leq}^p$, an optimal solution y^* of (P) is attained at an incomplete non-dominated vertex, i.e., there is $y^* \in V_y^{ic} \cap V_P$.

Primal Method

Initialization

- 1: *Initialization* ($k = 0$).
- 2: Compute the optimal value y_i^l of $(P_1(e^i))$, for $i = 1, \dots, p$.
- 3: Set $\mathcal{S}^0 := \{y^l\} + \mathbb{R}_{\leq}^p$, $k := 1$ and $V_{\mathcal{S}^0} := \{y^l\}$.
- 4: Threshold := False.
- 5: *Iteration steps* ($k \geq 1$).

Primal Method

Iterations

- 1: **while** $V_{S^{k-1}} \not\subset \mathcal{P}$ **do**
- 2: $s^k := \operatorname{argmax}\{\mu^T y : y \in V_{S^{k-1}}\},$
- 3: **if** $s^k \in \mathcal{P}$ and Threshold = False **then**
- 4: $S^k := S^{k-1} \cap \{y \in \mathbb{R}^p : \mu^T y \geq \mu^T s^k\}.$ Update $V_{S^{k-1}}.$
 Threshold := True.
- 5: **else**
- 6: Compute an optimal solution (x^k, z^k) to $P_2(s^k)$ and its
 dual optimal variable values $(u^k, \lambda^k).$
- 7: Set
 $S^k := S^{k-1} \cap \{y \in \mathbb{R}^p : \varphi(y, (\lambda_1^k, \dots, \lambda_{p-1}^k, b^T u^k)) \geq 0\}.$
 Update $V_{S^{k-1}}.$
- 8: **end if**
- 9: Set $k := k + 1.$
- 10: **end while**

Example

$$\max: y_1 + y_2 \text{ s.t. } y \in \mathcal{P}_N,$$

where \mathcal{P}_N is the extended non-dominated set of the following problem

$$\begin{aligned} \min & \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} \\ \text{s.t.} & \begin{pmatrix} 4 & 1 \\ 3 & 2 \\ 1 & 5 \\ -1 & -1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} \geq \begin{pmatrix} 4 \\ 6 \\ 5 \\ -6 \end{pmatrix} \\ & x_1, x_2 \geq 0. \end{aligned}$$

Geometric dual of (MOLP)

The dual of (MOLP) is

$$\max_{\mathcal{K}} \{(\lambda_1, \dots, \lambda_{p-1}, b^T u)^T : (u, \lambda) \geq 0, A^T u = C^T \lambda, e^T \lambda = 1\},$$

(DMOLP)

where $(u, \lambda) \in \mathbb{R}^m \times \mathbb{R}^p$.

$\mathcal{K} := \{v \in \mathbb{R}^p : v_1 = v_2 = \dots = v_{p-1} = 0, v_p \geq 0\}$ is the ordering cone in the dual objective space, and maximisation is with respect to the order defined by \mathcal{K} .

Example

Geometric Duality (Heyde and Löhne (2008))

$$\lambda(v) := \left(v_1, \dots, v_{p-1}, 1 - \sum_{i=1}^{p-1} v_i \right)^T$$

$$\lambda^*(y) := (y_1 - y_p, \dots, y_{p-1} - y_p, -1)^T.$$

Using the coupling function φ , let's define the following two set-valued maps

$$H: \mathbb{R}^p \rightrightarrows \mathbb{R}^p, H(v) := \{y \in \mathbb{R}^p : \lambda(v)^T y = v_p\}.$$

$$H^*: \mathbb{R}^p \rightrightarrows \mathbb{R}^p, H^*(y) := \{v \in \mathbb{R}^p : \lambda^*(y)^T v = -y_p\}.$$

Geometric Duality (Heyde and Löhne (2008))

The following theorems are essential to the primal and dual methods in the subsequent sections.

Theorem

Heyde and Löhne (2008) The following statements are equivalent

- (i) v is a \mathcal{K} -maximal vertex of \mathcal{V} .
- (ii) $H(v) \cap \mathcal{P}$ is a weakly non-dominated facet of \mathcal{P} .

Theorem

(Heyde and Löhne (2008)) The following statements are equivalent

- (i) y is a weakly non-dominated vertex of \mathcal{P} .
- (ii) $H^*(y) \cap \mathcal{V}$ is a \mathcal{K} -maximal facet of \mathcal{V} .

Dual Variant of Benson's Algorithm (Löhne et al. (2014))

- 1: Choose some $\hat{d} \in \text{int}\mathcal{D}$.
- 2: Compute an optional solution x^0 of $P_1(\hat{d})$.
- 3: Set $\mathcal{S}^0 := \{v \in \mathbb{R}^p : \lambda(v) \geq 0, \varphi(Cx^0, v) \geq 0\}$ and $k = 1$.
Iteration steps ($k \geq 1$)
- 4: **while** $\text{vert}\mathcal{S}^{k-1} \not\subseteq \mathcal{V}$ **do**
- 5: choose a vertex s^k of \mathcal{S}^{k-1} such that $s^k \notin \mathcal{V}$.
- 6: Compute $\alpha^k \in (0, 1)$ such that
 $v^k := \alpha^k s^k + (1 - \alpha^k)\hat{d} \in \mathcal{V}_{\mathcal{K}}$.
- 7: Compute an optimal solution x^k of $(P_1(v^k))$.
- 8: Set $\mathcal{S}^k := \mathcal{S}^{k-1} \cap \{v \in \mathbb{R}^p : \varphi(Cx^k, v) \geq 0\}$.
- 9: Set $k := k + 1$.
- 10: **end while**

Example

Example

Example

Example

Example

Example

Properties of (P) in dual objective space

$$L^\mu := \{v \in \mathbb{R}^p : v_1 = v_1^\mu, \dots, v_{p-1} = v_{p-1}^\mu\}.$$

Theorem

v^μ lies on $H^*(y^{ex})$

Therefore it is unnecessary to obtain the complete \mathcal{K} -maximal hyperplane set. Because we are just interested in finding the "highest" intersection point, i.e., the point with the largest last element value, between the \mathcal{K} -maximal hyperplanes and L^μ .

Example

Neighbouring relation

Definition

Two facets \mathcal{K} -maximal F^i and F^j of polyhedron \mathcal{D} are called neighbouring facets if $\dim(F^i \cap F^j) = p - 2$.

Proposition

If $y^i, y^j \in V_{\mathcal{P}}$, and y^i and y^j are neighbours in primal space. facets $F^i = H^(y^i) \cap \mathcal{D}$ and $F^j = H^*(y^j) \cap \mathcal{D}$ are neighbours.*

Projection of a three dimensional dual polyhedron onto the v^1 - v^2 coordinate plane

Properties of (P) in dual objective space

Definition

If all the neighbours of a facet are \mathcal{K} -maximal facets, then this facet is called a complete facet denoted by F^c . Otherwise, it is called an incomplete facet denoted by F^{ic} .

Theorem

A complete facet of \mathcal{D} corresponds to a complete vertex of \mathcal{P} and vice versa. An incomplete facet of \mathcal{D} corresponds to an incomplete vertex of \mathcal{P} and vice versa.

Dual method to solve (P)

Choose some $\hat{d} \in \text{int}\mathcal{V}$.

Compute an optimal solution x^0 of $P_1(\hat{d})$, $M^0 = \mu^T Cx^0$.

Set $S^0 := \{v \in \mathbb{R}^p : \lambda(v) \geq 0, \varphi(Cx^0, v) \geq 0\}$ and $k = 1$.

Iteration steps ($k \geq 1$)

while $W_D \cap V_{S^{k-1}} \neq \emptyset$ **do**

Choose $v \in W \cap V_{S^{k-1}}$ such that $v \notin \mathbb{V}$.

Compute $\alpha^k \in (0, 1)$ such that $v^k := \alpha^k s^k + (1 - \alpha^k)\hat{d} \in \mathbb{V}_{\mathcal{K}}$.

Compute an optimal solution x^k of $(P_1(v^k))$, $M^k = \mu^T Cx^k$.

if $M^k < M^{k-1}$ **then**

$M^* = M^k$

end if

Set $S^k := S^{k-1} \cap \{v \in \mathbb{R} : \varphi(Cx^k, v) \geq 0\}$.

Set $k := k + 1$.

end while

Example

$$\max: y_1 + y_2 \text{ s.t. } y \in \mathcal{P}_N,$$

where \mathcal{P}_N is the non-dominated set of the following problem

$$\begin{aligned} & \min \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} \\ \text{s.t.} & \begin{pmatrix} 4 & 1 \\ 3 & 2 \\ 1 & 5 \\ -1 & -1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} \geq \begin{pmatrix} 4 \\ 6 \\ 5 \\ -6 \end{pmatrix} \\ & x_1, x_2 \geq 0. \end{aligned}$$

y^I , y^N and y^{AI}

The nadir point $y^N \in \mathbb{R}^p$ is characterized by the componentwise maximal values of non-dominated points for (MOP), i.e.,

$$y_k^N := \max \{f^k(x) : x \in \mathcal{X}_E\} \quad k = 1, \dots, p.$$

Using y^N as a reference point

Compromise programming

$$\max \{ \|f(x) - y^N\| : x \in \mathcal{X} \}.$$

Primal method for nadir point

- 1: $N := \emptyset$.
- 2: Compute $\hat{x}^k \in \operatorname{argmin}\{c^k x : x \in \mathcal{X}\}$.
- 3: Compute $x^k \in \operatorname{argmin}\{\sum_{j \neq k} c^j x : x \in \mathcal{X}, c^k x = c^k \hat{x}^k\}$.
 $N = N \cup \{C x^k\}$.
- 4: Set $\mathcal{S}^0 := \{y^i\} + \mathbb{R}_{\geq}^p$.
- 5: $y_k := \max\{y_k : y \in N\}$.
- 6: $\mathcal{S}^1 := \mathcal{S}^0 \cap \{y \in \mathbb{R}^p : e^{kT} y \geq y_k\}$. Threshold = True. $i = 2$.

Primal method for nadir point

- 1: **while** $V_{S^{k-1}} \not\subset \mathcal{P}$ **do**
- 2: $s^i := \max\{y_k : y \in N \cup V_{S^{i-1}}\}$.
- 3: **if** $s^i \in \mathcal{P}$ and if Threshold = False **then**
- 4: $S^i := S^{i-1} \cap \{y \in \mathbb{R}^p : e^{kT} y \geq s_k^i\}$. Threshold = True.
- 5: **else**
- 6: Compute an optimal solution (x^i, z^i) to $P_2(s^i)$ and its dual variable values (u^i, λ^i) . $N = N \cup \{Cx^i\}$.
- 7: Set
- 8: $S^i := S^{i-1} \cap \{y \in \mathbb{R}^p : \varphi(y, (\lambda_1^i, \dots, \lambda_{p-1}^i, b^T u^i)) \geq 0\}$.
- 9: **end if**
- 10: $N = N \cup (V_{S^i} \cap \mathcal{P})$.
- 11: Set $i := i + 1$.
- 12: **end while**
- 13: $y_k^N = s_k^i$.

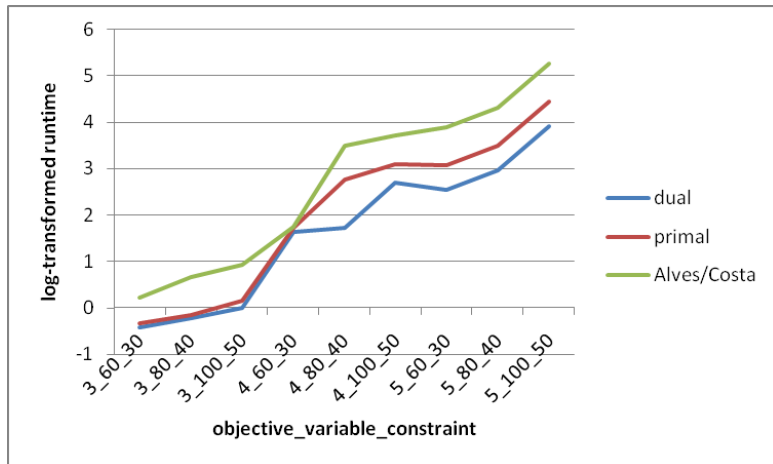

Dual method for nadir point

- 1: Perform the dual method to obtain the incomplete vertices.
- 2: **for** $k = 1, \dots, p$ **do**
- 3: $y_k^N = \max \{e^{kT} y : y \in Y\}$.
- 4: **end for**

Computational Experiments
