We want to solve a BOCO of the following form

min Cxs.t.: $Ax \le b$ $x \in \{0,1\}^n$

▲□▶▲□▶▲□▶▲□▶ □ のQ@

For simplicity

$$\blacktriangleright \mathcal{X} := \{ x \in \{0,1\}^n : Ax \le b \}.$$

• $\underline{\mathcal{X}} \coloneqq \{x \in [0,1]^n : Ax \le b\} \leftarrow$ The LP relaxation

Ord	lerings					

Definition

For $z^1, z^2 \in \mathbb{R}^2$ we say that $z^1 \leq z^2 \Leftrightarrow z_i^1 \leq z_i^2$, for i = 1, 2 $z^1 \leq z^2 \Leftrightarrow z^1 \leq z^2$ and $z^1 \neq z^2$ $z^1 < z^2 \Leftrightarrow z_i^1 < z_i^2$, for i = 1, 2

Cones

Definition

By \mathbb{R}^2_{\geq} we define the set $\mathbb{R}^2_{\geq} = \{z \in \mathbb{R}^2 : z \geq 0\}$ Similarly for $\mathbb{R}^2_{>}$ and $\mathbb{R}^2_{>}$.

Effi	ciency				

Definition

 $\hat{x} \in \mathcal{X}$ is called *efficient* if there does not exist another $x \in \mathcal{X}$ such that

$Cx \le C\hat{x}$

▲ロ▶ ▲冊▶ ▲ヨ▶ ▲ヨ▶ ヨー の々で

The corresponding outcome vector, $\hat{z} := C\hat{x}$, is called *non–dominated*.

Outline	Preliminaries 0000●	Branch & cut 0	Bound sets 00	Cutting planes	Bound update 000	Conclusions 0000	
Not	ation						

 \mathcal{X}_E set of all efficient solutions.

- \mathcal{Z}_N $C\mathcal{X}_E = \{z \in \mathbb{R}^2 : z = Cx, x \in \mathcal{X}_E\}$
- $\overline{\mathcal{Z}}$ upper bound set, $\overline{\mathcal{Z}} \subseteq C\mathcal{X}$.
- *L* lower bound set.
- η an active branching node.
- $\mathcal{X}(\eta)$ feasible set of node η .
- $\underline{\mathcal{X}}(\eta)$ LP relaxed version of $\mathcal{X}(\eta)$.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

Single objective branch and bound:

- 1. Pick an active node
- 2. If node is infeasible \rightarrow prune it.
- 3. Add cuts if necessary
- 4. Solve relaxation.
 - If solution is integral, update incumbent and prune.
 - If subproblem contains no improving solutions, prune. Else branch.

Bi–objective branch and bound:

▲ロ▶ ▲冊▶ ▲ヨ▶ ▲ヨ▶ ヨー の々で

Single objective branch and bound:

Bound fathoming: Explicit PIP-test

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 – 釣�?

Bound fathoming: Explicit LP-test

Perform the test using linear programming.

• z^N is a local Nadir point

Outline

• $\{\underline{z}^1, \ldots, \underline{z}^L\}$ extreme points of $(C\underline{\mathcal{X}}(\eta))_N$.

$$\min s_{1} + s_{2}$$
(1)
s.t.: $\sum_{l=1}^{L} \underline{z}_{1}^{l} \lambda_{l} - s_{1} \leq z_{1}^{N},$ (2)
 $\sum_{l=1}^{L} \underline{z}_{2}^{l} \lambda_{l} - s_{2} \leq z_{2}^{N},$ (3)
 $\sum_{l=1}^{L} \lambda_{l} = 1.$ $s_{1}, s_{2} \geq 0.$ (4)

Pruning 0000000

Implicit test using linear programming

- z^N is a local Nadir point
- $\underline{\mathcal{X}}$ LP relaxation

 $\min s_1 + s_2$ s.t.: $c^1 x \leq z_1^N$, $c^2 x \leq z_2^N$, $x \in \underline{\mathcal{X}}$. $s_1, s_2 > 0$.

Outline Preliminaries Branch & cut Bound sets Cutting planes Pruning Bound update Branching Conclusions Nodes are not dominated 0

Simple test to check if a node is *not* dominated:

Theorem

A branching node η *cannot be pruned by previous theorem, if there exits* $\lambda \in (0,1)$ *and* $z \in \mathcal{N}(\overline{Z})$ *such that*

$$Cx^{\lambda} \leq z$$

where $x^{\lambda} \in \arg\min\{(\lambda c^1 + (1 - \lambda)c^2)x : x \in \underline{\mathcal{X}}(\eta)\}.$

Solve scalarized LP–relaxation

$$\min\{(\lambda c^1 + (1-\lambda)c^2)x : x \in \underline{\mathcal{X}}(\eta)\}$$

before solving bi–objective LP–relaxation.

Inherit lower bound set of parent node, and update!

Bound set updating – Illustration

Bound sets 000 When should we update/resolve

If we branch in objective space, child nodes should be resolved (more on branching in a minute).

Outline

Preliminaries

If the lower bound set from scalarization strictly dominates that of parent node, then we resolve

Bound update

Outline Preliminaries Branch & cut Bound sets Cutting planes Pruning Bound update Branching Conclusions 00000 00000 00000 0000

When should we branch?

Single objective branch and bound:

- Pick an active node
- If node is infeasible \rightarrow prune it.
- Solve relaxation.
 - If solution is integral, update incumbent and prune.
 - If lower bound is worse than incumbent, prune. Else branch.

Bi–objective branch and bound

- Pick an active node
- If node is infeasible \rightarrow prune it.
- Solve (bi–objective) relaxation
 - If solution(s) integral, update incumbent *set* and branch.
 - If subproblem contains no efficient solutions, prune. Else branch.

Let $\bar{x} \in \mathcal{X}$. Create one! child node with the inequality

$$\sum_{i:\bar{x}_i=1} (1-x_i) + \sum_{i:\bar{x}_i=0} x_i \ge 1$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

Let $\bar{x} \in \mathcal{X}$. Create one! child node with the inequality

$$\sum_{i:\bar{x}_i=1} (1-x_i) + \sum_{i:\bar{x}_i=0} x_i \ge 1$$

Does only remove solution in decision space!

Outline Preliminaries Branch & cut Bound sets Cutting planes Pruning Bound update Branching Conclusions Integer branching – No–good inequalities

Let $\bar{x} \in \mathcal{X}$. Create one! child node with the inequality

$$\sum_{i:\bar{x}_i=1} (1-x_i) + \sum_{i:\bar{x}_i=0} x_i \ge 1$$

▲□▶▲□▶▲□▶▲□▶ ▲□▶ ● □ ● ● ●

- Does only remove solution in decision space!
- Might be many *equivalent solutions*

Outline Preliminaries Branch & cut Bound sets Cutting planes Pruning Bound update Branching Conclusions Integer branching – No–good inequalities

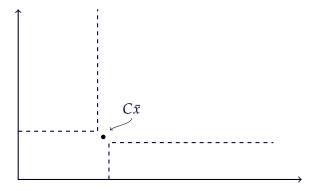

Let $\bar{x} \in \mathcal{X}$. Create one! child node with the inequality

$$\sum_{i:\bar{x}_i=1} (1-x_i) + \sum_{i:\bar{x}_i=0} x_i \ge 1$$

- Does only remove solution in decision space!
- Might be many *equivalent solutions*
- Use Pareto branching!

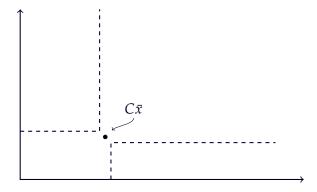

Integer branching - No-good in objective space

Tested if a bi-objective approach to cutting planes works

Outline		Bound sets 00	Cutting planes 0000	Bound update 000	
Res	ults				

- Tested if a bi–objective approach to cutting planes works
 - It does! The algorithm becomes much more robust and also faster.

◆□▶ ◆□▶ ◆ □▶ ★ □▶ = □ ● ○ ○ ○

Outline		Branch & cut 0	Cutting planes 0000			
Ree	ulte					

- ► Tested if a bi–objective approach to cutting planes works
 - It does! The algorithm becomes much more robust and also faster.
- Tested an updating strategy of the lower bound set
 - Works very well. Lower bounds are worse, but we can check many more subproblems.
